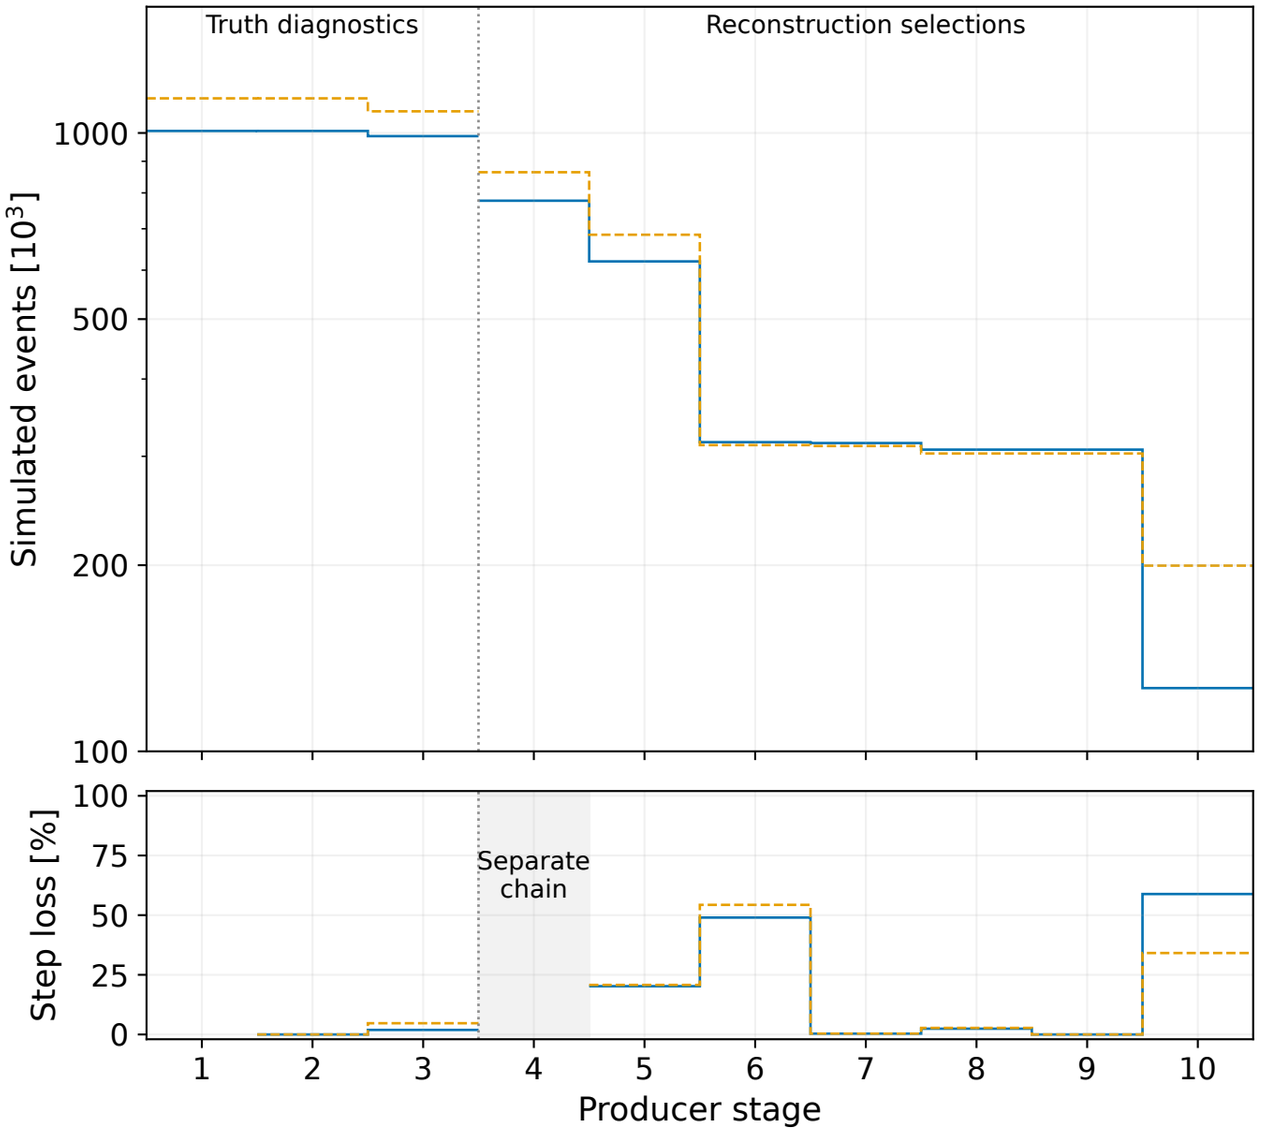
$\Upsilon(1S) \to e^+e^-$ producer event counters

ECAL-rematched samples · raw simulated event counts



Producer counter definitions

1. All processed events
2. Generated Y decay found
3. Both generated leptons have $|\eta| < 3.5$
4. At least one identified central e^+
5. Identified central e^+ and e^- available
6. Additional electron candidate available (second central electron or eligible tagger)
7. Valid assignment and $8 \le m_{ee} \le 12$ GeV
8. $|\Sigma(E - p_z) - 18| \le 1.8$ GeV
9. Reconstructed $W_{\gamma p} \ge 0$
10. RP or OMD proton candidate

Reconstruction starts from all processed events. Step losses use adjacent counters within each chain.
